Reduction in fat cells with ultrasound

With the new method Slimsonic achieved outstanding results in the following indications.

Applications:

- * Fat cell reduction (Sono-lipolysis)
- * Cellulite Applications
- * Connective tissue tightening
- * Fibrotic tissue transformation
- * Increase metabolism and blood flow
- * Scars-and wrinkle smoothing
- * Facial with Wirkstoffeinschleusung

The results:

- * Fat cells are removed
- * Body size is reduced visible and measurable
- * Goes back to cellulite, the skin becomes smooth and firm
- * Dense connective tissue
- * Wrinkles are softened, the skin receives a glowing complexion

The ultrasonic fat cell reduction (Sono-lipolysis) is a non-invasive method to gently and without significant side-effects of several centimeters circumference to lose. Especially around the abdomen, hips, thighs, saddle bags and the poor, the method is very effective.

Like the works Sono lipolysis?

The Slimsonic ultrasound system is one of the most advanced and most complete ultrasound equipment in the world market:

It includes the latest Ultraschallkavitationswellenlänge with 47 KHz and 3 MHz (HIFU) and 1 MHz ultrasound. In addition, a 1.4 MHz ultrasound probe for facials.

Ultrasonic waves in a range from 20 to 70 kHz can cause the so-called "cavitation". Concentrated high energy waves create micro-bubbles within the adipose tissue and in the interstitial fluid in cellulite. Thanks to the phase change of the liquid, the expansion and compression, implode the

fat cells, with the consequent release of water and fat, which is then removed by the liver and kidneys.
