UltraShape™ has developed the first ultrasound technology capable of non-invasively disrupting fat cells, and producing definite measurable and durable results. Based on therapeutic ultrasound that has a long history of safe and effective application in medical settings, UltraShape technology uses [focused ultrasound waves](#) which are directed at a specific target point on the body where they selectively break down unwanted fat cells without affecting surrounding structures. A unique feature of UltraShape technology is its highly sophisticated [optical tracking and guidance system](#) engineered to ensure safe, effective and uniform treatment.
