## Q-SONIC

Q-Sonic is an innovative device employed for localised slimming that generates hi-frequency ultrasound able to destroy the adipose cells. Q-Sonic is an effective tool against: fat, water retention and cellulitis, it is safe and its results are lasting.

### 4 source hand-piece

Q-Sonic is not just a simple ultrasound emitter, within its hand-piece there are four independent sources that simultaneously focalise their energy in the area to treat. This way you can treat the area where the adipose deposit is located, from four different directions, increasing the mechanical action of the device.

### Infrareds action.

The thermal action induced by infrared stimulates deeply the biological tissue. Infrared have the capability to penetrate in depth into tissues, inducing heat and favouring vasodilatation, as an immediate consequence it improves the venous and lymphatic circulation.

Cell revitalisation and the reopening of interchange between the blood vessels and the lymphatic ones is an indicator of improved circulation, and indispensable requirement when eliminating cellulitis.

Improving the lymphatic circulation is the first step to prevent and fight cellulitis. Infrared reactivates cellular metabolism, favouring absorption of the interstitial liquids and the reduction of the oedema that characterises a cellulitis outbreak.
