**True color photograph of a Titanium foil 5cm by 5cm as seen upon removal from an sonoreactor. The pattern reveals acoustic standing wave resonance in this foil which also produced a large amount of heating:**

source: <http://rsrch.com/saturna/sonofusion.html> source: <http://rsrch.com/saturna/sonofusion.html>  
(Link does not longer exist)

**Scanning electron micrograph of a glassy carbon surface after sonication in water for 5 minutes:**

source: <http://www.chem.duke.edu/~coury/sonic2.html> (URL does no longer exist)

**A scanning electron micrograph of a brass plate after a few shocks. Notice the craters that are formed. These are indicative of damage by high speed jets caused by collapsing cavitation bubbles:**

source: <http://pluto.apl.washington.edu/harlett2/artgwww/acoustic/medical/litho.html>

**Images of a polished platinum electrode surface before being exposed to ultrasound (above) and the same electrode after being exposed to full power ultrasound from a 20kHz horn for 600 seconds (bottom):**

source: <http://physchem.ox.ac.uk:8000/research/sono/surffx.shtml>

**Particle size reduction by ultrasound (left - before sonication, right - after sonication):**

source: <http://www.aeat.co.uk/sono/> (Link does not longer exist)

**Cavitation events serve as nuclei for new crystals to form and grow. At high intensities ultrasound can be used instead of seed crystals, and/or to start nucleation at a lesser degree of supersaturation than would normally be the case:**

source: <http://www.aeat.com/sono/>

**Effect of ultrasound on the habit and perfection of sorbitol hexaacetate crystals:**

source: <http://www.aeat.com/sono/>

**Control of the crystal size distribution of dodecanedioic acid. The solid line shows the base case where no ultrasound was used; the dashed line shows where ultrasound was used to nucleate the solution; and the chain linked line shows where ultrasound was used continuously throughout the crystallization. Insonation to nucleate shows a marked increase in the mean crystal size, whereas continuous insonation has dramatically reduced the mean size:**

source: <http://www.aeat.com/sono/>

**Images of p-chloranil single crystals before dissolution and after dissolution under silent and sonicated conditions:**

Figure 1. Atomic force microscopy image of a single crystal (001 face) recorded in air before any dissolution indicating that the crystals before dissolution are very smooth; the surfaces show

steps of height ca. 10 Å and multiples there-of. This value approximates to the unit cell dimension. (left) and image of a single crystal (001 face) recorded in air after dissolution under an aqueous solution of 0.2M KCl indicating that after dissolution some surface roughening is observed (right):

source: <http://physchem.ox.ac.uk:8000/research/sono/emma.shtml>

Figure 2. Atomic force microscopy image of a single crystal (001 face) recorded in air after dissolution under an aqueous solution of 0.2M KCl/15mM KOH for a period of 5 minutes in the presence of power ultrasound leading to the formation of pits as deep as 5 mm:

source: <http://physchem.ox.ac.uk:8000/research/sono/emma.shtml>

Figure 3. Three dimensional plot of an atomic force microscopy image of a single crystal (001 face) recorded in air after dissolution under an aqueous solution of 0.2M KCl/15mM KOH and subjection to a period of 5 minutes of ultrasound. The heavy pitting seen suggest that transient bubble collapse plays a significant role in the interfacial dissolution mechanism in the presence of ultrasound:

source: <http://physchem.ox.ac.uk:8000/research/sono/emma.shtml>

## Sonoelectrochemical cells:

source: <http://physchem.ox.ac.uk:8000/research/sono/emma.shtml>

source: <http://www.bk.psu.edu/faculty/cooper/> (URL does no longer exist)

If electrodes were sonicated in relatively non-volatile organic solvents (e.g., dioxane), they were rendered highly active and showed faster electron transfer kinetics for various redox couples when placed in aqueous solutions. This can be seen in the figure below, since the peak splitting in the cyclic voltammogram decreases markedly after sonication:

source: <http://www.chem.duke.edu/~coury/sonic2.html> (URL does no longer exist)

# ESS - Insight View

## ➔ Join the ESS

The European Society of Sonochemistry is a non-profit organisation. The society and its members are interested in the promotion of the application of ultrasound in chemistry and related fields (e.g. materials science, medicine, biotechnology). Therefore, close contacts between sonochemists are maintained worldwide. Furthermore, the contact to chemists who have no or only some experience in sonochemistry is another main objective of the ESS. Thus, the bi-annual ESS meetings welcome not only sonochemists from all over the world but invite all chemists, physicists and other scientists interested in the application of ultrasound and sonochemistry. The ESS consists currently of 138 members from 28 countries of Europe, Northern America, Australia and Asia.

## ➔ The Board

**The ESS-Board currently consists of 11 members. The members have been elected by the last ESS General Assembly in Biarritz on May 17, 2000. The board**

# Sonochemistry - Introduction

## ➔ Fundamentals

### What is Sonochemistry ?

Sonochemistry is the application of ultrasound to chemical reactions and processes. Ultrasound is the part of the sonic spectrum which ranges from about 20 kHz to 10 MHz and can be roughly subdivided in three main regions: low frequency, high power ultrasound (20-100 kHz), high frequency, medium power ultrasound (100 kHz-1 MHz), and high frequency, low power ultrasound (1-10 MHz). The range from 20 kHz to around 1 MHz is used in sonochemistry whereas frequencies far above 1 MHz are used as medical and diagnostic ultrasound.

### Acoustic Cavitation

The origin of sonochemical effects in liquids is the phenomenon of acoustic cavitation. The term cavitation comes from the latin word *cavus* = cavity. Acoustical energy is mechanical energy i.e. it is not absorbed by molecules. Ultrasound is transmitted through a medium via pressure waves by inducing vibrational motion of the molecules which alternately compress and stretch the molecular structure of the medium due to a time-varying pressure. Therefore, the distance among the molecules vary as the molecules oscillate around their mean position. If the intensity of ultrasound in a liquid is increased, a point is reached at which the intramolecular forces are not able to hold the molecular structure intact. Consequently, it breaks down and a cavity is formed. This cavity is called cavitation bubble as this process is called cavitation and the point where it starts cavitation threshold. A bubble responds to the sound field in the liquid by expanding and contracting, i.e. it is excited by a time-varying pressure. Two forms of cavitation are known: stable and transient. Stable cavitation means that the bubbles oscillate around their equilibrium position over several refraction/compression cycles. While transient cavitation, the bubbles grow over one (sometimes two or three) acoustic cycles to double their initial size and finally collapse violently.

The size, life time and fate of a cavitation bubble depend on the following parameters: frequency, intensity (acoustic pressure), solvent, bubbled gas, external parameter (temperature, pressure). However, it should be noted that there is often no simple

relationship.

For some images on the cavitation collapse see the special page on [images of sonochemistry and sonoluminescence](#).

## Physical Effects

There are three different theories about cavitation - the hot-spot, the electrical and the plasma theory. The most popular one is the hot spot theory. Thus, it has been experimentally shown that the cavitation collapse creates drastic conditions inside the medium for an extremely short time: temperatures of 2000-5000 K and pressures up to 1800 atm inside the collapsing cavity. A remarkable event during the cavitation collapse is the emission light under certain conditions ([sonoluminescence](#)). Furthermore, the collapse causes a couple of strong physical effects outside the bubble: shear forces, jets and shock waves. Thus, there are basically two groups of effects: radical and mechanical effects. These cavitation-induced effects can cause physical, chemical, and biological effects. Thus, ultrasound has been found applications in chemistry, materials and life sciences as well as medicine.

## Chemical Effects

There is no doubt that the origin of sonochemical effects is cavitation. There are three possible reaction sites of a collapsing bubble: the cavity interior, the bubble vicinity and the bulk solution. Due to the extreme conditions inside the medium and other cavitation effects the following effects depending on the sonication conditions have been found :

### radical effects

- ligand-metal bond cleavage in transition metal complexes to give coordinatively unsaturated species or modified complexes as well as complete strip off of ligands to produce amorphous metals
- disruption of the solvent structure altering the solvation of reactants
- sonolysis of molecules (homolytic fragmentation to radicals, rupture of polymers, generation of excited states, cell disruption)

### mechanical effects

- mechanical effects by cavity collapse onto metals and solids (shear forces, jets and shock waves resulting in rapid mass transfer, surface cleaning, particle size reduction)

- and metal activation), modification of the properties of solid particles
- influence on electrochemical processes
- effects in liquid-liquid systems (improved mass transfer, emulsification, increase of the effect of phase transfer catalysts or even their replacement)
- effects in gas-liquid systems (degassing of liquids or melts, atomisation of liquids in air, thin film preparation)
- single electron transfer (SET) steps in chemical reactions may be accelerated and if an ionic and an electron transfer pathway are possible the latter seems to be preferred ("sonochemical switching")

## ➔ **Ultrasound in Chemistry, Materials and Life Sciences**

There are a wide range of applications of ultrasound in these fields. Therefore, only a selection of important and interesting examples and effects are given in the following to show the far range of possible applications and just to give an impression what ultrasound/sonochemistry means.

### **Applications in Chemistry**

The following beneficial sonochemical effects onto chemical reactions and processes can be observed :

- decrease of reaction time and/or increase of yield
- use of less forcing conditions e.g. lower reaction temperature
- possible switching of reaction pathway
- use of less or avoidance of phase transfer catalysts
- degassing forces reactions with gaseous products
- use of crude or technical reagents
- activation of metals and solids
- reduction of any induction period
- enhancement of the reactivity of reagents or catalysts

generation of useful reactive species

## Applications in Materials Science

There are some obstacles if a reaction should proceed between a solid and a liquid (or in a liquid dissolved) reactant in a heterogeneous system: the small surface area of a bulk solid, the solid surface may be coated by oxide layers or impurities, species have to diffuse to and away from the solid surface, deposition of products may inhibit further reactions.

Applications of ultrasound to such systems are:

- preparation of activated metals by reduction of metal salts (e.g. reduction with Li in THF to RIEKE-type powders or with formaldehyde to Pd or Pt), generation of activated metals by sonication, precipitation of metal (Cr, Mn, Co) oxide catalysts, impregnation of metals or metal halides on supports
- preparation of activated metal solutions (e.g. colloidal alkali metal solutions, suspension of Mg or Hg), preparation of organometallic compounds from main group or transition metals, sonochemical reactions involving metals via in situ generated organoelement species, reactions involving non-metallic solids
- crystallisation and precipitation of metals, alloys, zeolites and other solids, agglomeration of crystals, degassing of melts, spray pyrolysis to form thin films or fine particles, treatment of solid surfaces, dispersion of solids, preparation of colloids (Ag, Au, Q-sized CdS)
- ultrasonic sieving, filtration and micromanipulation (transportation, concentration, fractionation) of small particles, intercalation of guest molecules into host inorganic layered solids, ultrasonic-aided development in advanced lithography, electroless plating, wetting and impregnation
- sonochemistry of polymers consisting of three main fields: the degradation and modification of polymers, the ultrasonically assisted synthesis of polymers and the determination of the polymer structure
- sonolysis of organic pollutants in water has become a developing field of research in environmental technology
- ultrasonic plastic and metal welding, machining, ultrasonic soldering
- sonocleaning
- spraying, metal welding, machining and surface hardening

ultrasound food technology (fields of interest: mixing, blending, extraction, crystallisation, foam destruction, particle/aerosol precipitation, oxidation)

## Ultrasound in Life Sciences and Medicine

Firstly, applications without any destruction or damage on living tissues :

- disturbing of dermal cell membranes used for drug delivery (sonophoresis)
- ultrasonic imaging
- ultrasound nmr
- diagnostic ultrasound
- dental scaling and ultrasonic nebulizers in medical therapy
- enzyme activation

Secondly, ultrasound caused damage on living tissues :

- cell disruption (extraction of plant substances, disinfecting, enzyme deactivation)
- therapeutic ultrasound, i.e. induction of thermolysis in tissues (cancer treatment)
- 

Thirdly, sonochemical preparation of biomaterials

- air-filled protein microbubbles
- nonaqueous liquid-filled protein microcapsules

---

## ➔ Sonoluminescence

There are two forms of sonoluminescence: single-bubble SL and multi-bubble SL. Sonoluminescence was first discovered in 1930s. But, only in the late 1980's an intensive research started. The first researchers saw multiple-bubble sonoluminescence (MBSL), i.e. the glow from many bubbles of air in water. Since the glow for these bubbles is so faint, it must be viewed in a darkened room. Single-bubble sonoluminescence (SBSL), however, can be seen in a lighted room. 1990, however, was the first year that SBSL was observed, discovered by Gaitan and Crum, who after extensive research, found just the right conditions for SBSL to occur. To create SBSL, a single bubble of gas must be placed in the liquid. This can be done by injecting a bubble of air with a syringe, but researchers today use more elaborate setups. After being injected into the center of a cylindrical flask, the bubble would normally rise, but it is held in place by the force of the sound waves bombarding it. Around 110 decibels are required for sonoluminescence, and while this volume might seem high enough to cause deafness, the frequency of the sound is also important for SL, and it lies just beyond the range of human hearing. Putterman and his group discovered that the light flashes have an upper bound of 50 picoseconds (ps), and these flashes come out with incredible regularity.

For a detailed introduction look on [other SL-websites](#).

For some images on SL see the special page on [images of sonochemistry and sonoluminescence](#).

## ➔ Historical Milestones

1867	Early observations of cavitation (TOMLINSON, GERNEZ)
1880	Discovery of the piezoelectric effect
1883	Earliest ultrasonic transducer by GALTON
1894	Cavitation as phenomenon recognized and investigated on propeller blades of HMS Daring (THORNYCROFT and BARVABY, Minutes of Proceedings of the Institution of Civil Engineers <b>122</b> (1895) 51)
1915-17	Pioneering work on ultrasonic acoustics by LANGEVIN

1917	First mathematical model for cavitation collapse predicting enormous local temperatures and pressures (RAYLEIGH)
1927	First paper on chemical effects of ultrasound published (RICHARDS and LOOMIS, J. Am. Chem. Soc. <b>49</b> (1927) 3086)
1933-35	Observation of sonoluminescence effects
1933	Reports on the reduction in the viscosity of polymer solutions by ultrasound
1943	First Patent on cleaning by ultrasound (German Pat. 733.470)
1944	First patent on emulsification by ultrasound (Swiss Pat. 394.390)
1950s	Intensification of cavitation and ultrasound research, increasing number of applications using ultrasound
1950	Effect of ultrasound on chemical reactions involving metals (RENAUD, Bull. Soc. Chim. Fr. (1950) 1044)
1950	Hot spot model (NOLTINGK and NEPPIRAS)
1953	First review on the effects of ultrasound (BARNARTT, Quart. Rev. <b>7</b> (1953) 84)
1963	Introduction of plastic ultrasonic welding
1964	First monograph on physical, chemical and biological effects of ultrasound (ELPINER)
1970s	Renaissance of sonochemistry research
since 1980	Growing research on sonochemical effects
1986	First ever international meeting on sonochemistry
1990	Foundation of the European Society of Sonochemistry and ESS 1 Meeting

## Sonochemistry in Rostock

[ [SonoResearch in Rostock](#) ]

[ [SonoGroups in Germany](#) ]

### Sonochemistry Research in Rostock

 The sonochemistry research in Rostock focuses on the application of ultrasound to chemical reactions (e.g. organic syntheses), liquid and solid processing as well as to other technical-related processes. The main research fields are:

- applications in organic syntheses (e.g. organofluorine compounds, carbohydrate derivatives, amphiphilic compounds)
- ultrasound in multi-phase processes
- impact of ultrasound onto solid surfaces
- sonolysis of organic water pollutants
- ultrasound impact in biological systems

### Reviews:

# ESS - Membership

---

## ➔ Join the ESS

The ESS welcomes people not only from Europe but also from all other countries around the world. You can become a personal member or a member as a representative of a company, organisation or other body. It implies compliance with the present bylaws and with the decisions taken by the General Assembly and the Board. Membership is subject to a fee proposed by the Board and approved by the General Assembly of the members.

The annual membership fee is currently **30 EURO**.

Download the **Membership Information Package** for all information concerning the membership. For application to the ESS membership fill in the included **Membership Application Form** and one of the **Membership Fee Payment Forms** and send both to the ESS.

[Membership Information Package](#)  
([Acrobat PDF](#))

## ➔ Fee Payment

Membership fee payment is possible by **Bank Transfer** or - preferably - by **Credit Card (VISA or EUROCARD or MASTERCARD)**. Payment by **Cheque** is not possible. for details see the [Membership Information Package](#).

The ESS recommends strongly to pay by **Credit Card** because of cost and expenses concerns.

### Credit Card

Please fill in the [Credit Card Payment Form](#) (VISA, EUROCARD, MASTERCARD) and mail it to the [ESS-Treasurer](#).

Please mark clearly the appropriate year(s) and the expiration date of your card.

### Bank Transfer

Remit the membership fee by bank transfer to the ESS-account and mark clearly on your transfer form the appropriate year(s) and name. In addition, you are requested to download, fill in and send the [Bank Transfer Information Form](#) via e-mail or snail mail to the [ESS-Treasurer](#).

**We remind the members that they have to pay all bank expenses.**

### Cheque

**NOT POSSIBLE !**

## Embedded Secure Document

The file <http://www.fb-chemie.uni-rostock.de/ess/membership/membership.pdf> is a secure document that has been embedded in this document. Double click the pushpin to view.

## VISA / EUROCARD / MASTERCARD

# CREDIT CARD PAYMENT FORM FOR THE ESS MEMBERSHIP FEE

( Please **mark clearly** the appropriate box for the year(s) ! )

I would like to pay by credit card my European Society of Sonochemistry (ESS) membership fee for the following year(s):

- 2000 (30 EURO)
- 2001 (30 EURO)
- 2002 (30 EURO)

Total amount : \_\_\_\_\_ EURO

Name: \_\_\_\_\_ First Name: \_\_\_\_\_

Country: \_\_\_\_\_ City: \_\_\_\_\_

Address: \_\_\_\_\_

### PAYMENT BY CREDIT CARD :

I approve the ESS to withdraw the above total amount of my membership fee by credit card. I

confirm that I am the credit card holder. My credit card is valid and the following card data are correct. Please note that this form is **only** for **CREDIT CARD PAYMENT** and tick your card.

VISA

EUROCARD

MASTERCARD

card number: \_\_\_\_\_

expiration date: \_\_\_\_\_

emission bank or organisation: \_\_\_\_\_

city: \_\_\_\_\_ date: \_\_\_\_\_

signature: \_\_\_\_\_

**Please print and send to:**

mail to:

Dr. G.J.Price  
School of Chemistry,  
University of Bath,  
Bath BA2 7AY, U.K.

# BANK TRANSFER INFORMATION FORM

Name: \_\_\_\_\_ First Name: \_\_\_\_\_

Country: \_\_\_\_\_ City: \_\_\_\_\_

Address: \_\_\_\_\_

## European Commission - COST Chemistry Action D6 / D10

COST (European Cooperation in the field of Scientific and Technical Research) is a framework for scientific and technical cooperation, allowing the coordination of national research on a European level. COST Actions consist of basic and precompetitive research as well as activities of public utility.

There are 25 COST member countries : the fifteen EU Member States plus Iceland, Norway, Switzerland, the Czech Republic, Slovakia, Hungary, Poland, Turkey, Slovenia, Croatia and the European Commission.

**COST Homepage:** <http://www.cordis.lu/cost/home.html>

**COST Chemistry Homepage :** <http://www.unil.ch/cost/chem/>

Within the COST Chemistry framework there are two action (D6, D10) which are directly involve sonochemistry and the application of ultrasound:

### **COST Chemistry D6 Action**

#### **CHEMICAL PROCESSES AND REACTIONS UNDER EXTREME OR NON-CLASSIC CONDITIONS**

Start of the Action: 10.09.1992

End of the Action: 09.09.1997

The main objective for COST D6 can be summarized as the "Investigation of the chances offered by process technologies under extreme or unusual conditions for highly reactive and selective methods in chemical technology". It should aim at possible applications in the process integrated environmental protection and the synthesis of materials with unconventional properties.

### **COST Chemistry D10 Action**

## INNOVATIVE METHODS AND TECHNIQUES FOR CHEMICAL TRANSFORMATIONS

Start of the Action: 1997

End of the Action: 2002

The main objective of D10 is to stimulate research activities focused on the application of innovative methods and techniques for chemical transformations at a fundamental and applied level. Different methods and techniques involving extreme or non-classical conditions should be investigated and applied at an industrial level. This will require the close cooperation of engineers, chemists and physicists. The ultimate aims are lower energy consumption, less pollution (clean chemistry) and higher selectivity in chemical transformations.

## ➔ 2nd Meeting on Innovative Energy Sources in Chemical Engineering

Dortmund (Germany), January 22,  
2001

Organiser:  
**University of Dortmund, Department of  
Chemical Engineering**

### Lectures

D. Agar, J. Reuß	What is the current potential for reaction engineering with electrical and dielectric energy sources
R. Mettin, S. Luther, P. Koch, W. Lauterborn	Investigation and characterization of cavitation bubble fields
M. Breitbach, D. Bathen, H. Schmidt- Traub	Ultrasound-induced desorption
D. Peters, M. Hein	Application of ultrasound to reactions in liquid-liquid 2-phase systems
W. Bonrath	Chemical reactions under non-classical conditions - use of microwaves and ultrasound in vitamin production
R. Herrmann, W. Schwieger	Microwave heating and ultrasound monitoring in zeolith synthesis
B. Eder, F.W. Günthert	Sludge minimization by cell disruption with ultrasound
R. Jung	Textil and leather dyeing with ultrasound

U. Kühne, K.  
Fritsching, K.  
Bauckhage

Transportation of disperse powders

## ➔ Sonochemistry Information Day

Frankfurt/Main (Germany),  
December 11, 2000

Organiser:  
**DECHEMA**

## Lectures

A. Gallaher	Can Sonar help sonochemistry ?
D. Peters	Influence of different sonochemical parameters on liquid-liquid 2-phase reactions
F. Keil	Modelling of sonic fields in reactors
C. Horst	Chemical and process engineering for competitive organometal synthesis in ultrasonic reactors
W. Bonrath	Industrial application of sonochemistry: chances and possibilities

## ➔ 9th Symposium of the Japan Society of Sonochemistry (JSS-9)

Tokyo (Japan), November 28-29, 2000

Organiser:  
**Japan Society of Sonochemistry**

## Plenary Lectures

N. Enomoto, Y. Shigyo, M. Uehara, J. Hojo	Effect of Ultrasound on Magnetic Particles Synthesis Involving Oxidation Process
E. Takagi, Y. Mizukoshi, R. Oshima, Y. Maeda, Y. Nagata	Sonochemical Preparation of Noble Metal Nanoparticles and Observation of Particles in the Growing Process
H. Kago, T. Fujimoto, Y. Mizukoshi, Y. Nagata, Y. Maeda, R. Oshima	Sonochemical Preparation of Manganese Dioxide Particles
S. Hatanaka, K. Yasui, H. Mitome	Effect of Fluid Motion on Multibubble Sonoluminescence
T. Tsuziuchi, S. Hatanaka, K. Yasui, T. Kozuka, H. Mitome	On the Ambient-Pressure Dependence of Multibubble Sonoluminescence
K. Yasui	Stable Bubbles in Multibubble Sonoluminescence
Y. Seida, Y. Nakano	Synthesis of Layered Double Hydroxide by Ultrasound
M. Fukuhara, A. Matsui*, M. Takeshima	Low-Temperature Elastic Anomalies in an Anthracene Single Crystal
Y. Sakabe, K. Kuroda, K. Hirano	Sonochemical Deposition of Noble Metals from Their Aqueous Chloride Solutions. Addition Effects of Some Alcohols and Organic Acids
K. Kawabata, N. Sugita, K. Sasaki, S. Umemura	Tumor Accumulative Amphiphilic Derivatives of Xanthene Dyes Capable of Reducing Cavitation Threshold
K. Hashiba, K. Kawabata, H. Masuzawa, S. Umemura, M. Izeki, Y. Maeda	Stable Cavitation Fields by Using Squeeze-Film Effect

Jean-Louis Luche	Ultrasound, a Potent Tool for Kicking-off Green Chemistry
H. Sohmiya, T. Kimura, M. Fujita, T. Ando	The Effect of Heterogeneity on Sonochemical Reactions of Thiols in Water-Organic Solvent Systems
H. Harada	Sono-Catalytic Decomposition of Water using $\text{FeNH}_4(\text{SO}_4)_2$
Y. Takizawa, K. Ariyoshi, M. Hitomi	Synthesis of Alkoxy and Esters of Phenols using Ultrasonic Irradiation
H. Mori, Q.-L. Zhao, T. Kondo	Effects of Dissolved Gases and of an Echo Contrast Agent, Levovist, on Apoptosis Induced by Ultrasound
K. Okitsu, Y. Yoshioka, S. Tanabe, H. Matsumoto	Sonochemical Degradation of Volatile Chlorinated Organic Compounds in Heterogeneous Aqueous Solution
A. Yue, K. Okitsu, S. Tanabe, H. Matsumoto	Formation of Gold Colloids in Ultrasonic Field. Control of Rate and Particle Size, and Mechanism
E. Umeki, H. Yanagida, Y. Masubuchi, J. Takimoto, K. Minagawa, K. Koyama	Effect of Reaction Temperature on Ultrasonic Polymerization of Poly(N-isopropyl acrylamide)
E. Sato, E. Umeki, H. Yanagida, Y. Masubuchi, J. Takimoto, K. Koyama	Effect of End Structure, Concentration and Molecular Weight of Solute Polymers on Generation of Radical Induced by Ultrasound
M. Aihara, E. Umeki, H. Yanagida, Y. Masubuchi, J. Takimoto, K. Koyama	Synthesis of Copolymers from Water-Soluble Monomers by Ultrasonic Irradiation
S. Koda	Application of Power Ultrasound to Polymer Chemistry
K. Tanaka, S. Koda, T. Matsuoka, H. Nomura	Single-Bubble Sonoluminescence from Aqueous Alcohol

Y. Maeda, M. Nakanishi, S. Mukai, M. Izeki, I. Kimata	Sonolytical Inactivation of Cryptosporidium
B. Yim, Y. Nagata, Y. Maeda	Decomposition of Diethyl Phtalate in Water by Ultrasonic Irradiation
M. Fujita, T. Kimura, H. Sohmiya, T. Ando	Halogenation of Alkanes under Ultrasonic Irradiation
M. Atobe, T. Nonaka	Electroorganic Reactions under Ultrasonic Irradiation (44). Electroreduction of Dimethyl Maleate in Acoustic Fields Produced by a various Types of Ultrasonic Oscillator
